

A virtual font for URW Chancery Math

March 11, 2011

The URW clone of the universally available PostScript font Zapf Chancery may be used as a math calligraphic font by means of the following lines in the preamble:

```
\DeclareFontFamily{OT1}{pzc}{}  
\DeclareFontShape{OT1}{pzc}{m}{it}{%  
    <-> s * [1.15] pzcmi7t{}}  
\DeclareMathAlphabet{\mathpzc}{OT1}{pzc}{m}{it}
```

The results are not always good if you attach math accents or sub-/super-scripts as the metrics are designed for a text font rather than a math font.

This small package provides a virtual math font linked to `uzcmi8r` with side-bearings, subscript position and accent position adjusted manually for each glyph. Following

```
\usepackage[scaled=1.15]{urwchancal}
```

which redefines `\mathcal` to output URW Chancery glyphs, the input line

```
\[A=\bar{a}\mathcal{M}^2_k+\hat{z}\mathcal{Z}.\]
```

yields

$$A = \bar{\mathcal{M}}_k^2 + \hat{\mathcal{Z}}.$$

In addition to `scaled`, there is an option `mathscr`, which enables `\mathscr` rather than `\mathcal` to point to URW Chancery.

The long tails on some of the glyphs make this font problematic as a math font, but it has some virtues, not the least being its universal availability. For a font of similar appearance without the long-tail problems, consider the script font in Mathematica5.
